

36. Ideal Differentiation and the Different

J. Ber. d. DMV 39 (1930), p. 17

2. E. NOETHER, Göttingen: Ideal differentiation and the different.

It is shown how the different of an algebraic number field can be regarded as the *differential quotient* of a defining *ideal*. That this definition agrees with the usual one follows from structural theorems which are interesting in themselves and which, in an analogous sense, constitute a generalization of the Lagrange interpolation formula.

A detailed account is to appear in *Math. Ann.*
