1 Purpose

This release records an executable normalization method applied to the complete extant Noether Interslavic production corpus. It turns reviewed linguistic decisions into bounded, inspectable changes while preserving rejected, unreviewed, or context-sensitive forms for later review.

The associated Noether release is the publication surface for the actual translation bodies and readers:

- Noether concept DOI: [10.5281/zenodo.20412587](https://doi.org/10.5281/zenodo.20412587)
- Current 18 July 2026 record: [10.5281/zenodo.21421049](https://doi.org/10.5281/zenodo.21421049)
- 221 canonical Latin-script TeX units and a 529-page reader
- 221 canonical Cyrillic-script TeX units and a 552-page reader

This sidecar contains the method, evidence, diffs, scripts, and quality-control record. It does not duplicate the complete 442-body corpus.

2 Governing distinction

Four forms of evidence must not be conflated:

1. **Mechanical closure** means that an authorized exact source form has no remaining residue in the declared corpus scope.
2. **Build and render integrity** means that the changed TeX compiles and that its pages have no detected blank, clipped, dark, or missing-glyph failures.
3. **Internal linguistic normalization** means that reviewed decisions were consistently executed across the corpus.
4. **External linguistic acceptance** requires suitable independent or community review and is not claimed here.

Likewise, source-faithful mathematical transcription is a separate question from interlanguage normalization. Successful lexical or orthographic rollout does not certify the underlying mathematical edition.

3 Corpus boundary

The canonical production boundary is exactly the paired Noether translation tree selected by `**/inter-slavic/v001/*.tex` and `**/interslavic-cyrillic/v001/*.tex`. Working copies, cumulative drafts, preimages, renders, and retained tranche material are excluded from the source selection.

The final audit covers 221 Latin units and 221 Cyrillic units. A wider filename and content inventory found no additional non-Noether Interslavic translation corpus in the workspace. The aggregate path-and-file hash for the final Latin selection is:

D930B9CD20647FC6C23CA60EAE47214D5784B8F4D43D46C1A9451CFB95F62544

4 Tranche 002A: reviewed orthography

Tranche 002A applied only reviewed, paired-script orthographic mappings:

Source family	Target family	Post-run source residue
vzet-	vzēt-	0
obšč-	obć-	0
długost-	dolgost-	0
voobče / vobče	obće	0

The pass changed 146 TeX files: 69 Latin and 77 Cyrillic. It applied 331 paired-script replacements. The previously completed Paper 06 pilot was not silently repeated. No lexical or held family was touched.

One pre-existing Paper 35 Cyrillic defect was isolated during compilation. Blind transliteration had altered mathematics, environment names, and the TeX unit pt. Those structural spans were restored from the aligned Latin sibling without replacing Cyrillic prose. The preimage, repair report, and diff are retained.

The build gate compiled 146 of 146 changed units, producing 467 pages. The recorded diagnostic counts are zero for TeX/package errors, missing characters, overfull boxes, and underfull boxes. All 467 pages were rendered serially; no machine page flag was raised, and the all-page sheets plus stratified samples passed manual layout inspection.

5 Tranche 002B: exact lexical surfaces

Tranche 002B applied only exact accepted surfaces:

Exact source surface	Applied target
odnvrěmenno	jednočasno
odnovremenno	jednočasno
odnovočasno	jednočasno
istočasno	jednočasno
korak	krok

Deterministic Cyrillic counterparts were changed in the paired units. The pass changed 92 files, exactly 46 Latin and 46 Cyrillic, with 224 replacements. It did not apply a broad correspondence-family substitution and did not touch held rows.

The build gate compiled 92 of 92 changed units, producing 376 pages. Recorded TeX/package errors, missing characters, overfull boxes, and underfull boxes are all zero. All 376 pages rendered serially with no machine page flags; all-page and stratified manual layout checks passed.

6 Idempotence and evidence retention

Both passes were rerun as idempotence checks. A second run produced no further authorized changes. For each tranche the public evidence package retains:

- exact preflight and post-run reports;
- a row-level change ledger;
- the applied unified diff;
- build journals and aggregate build reports;
- render metrics and human visual-inspection notes;
- all-page master sheets;
- the scripts used to apply, build, render, and audit the work.

This makes the change boundary inspectable without treating generated output as independent linguistic authority.

7 Correction preserved by the method

An earlier draft overclaimed that jednočasno was the single standard form. The checked community dictionary instead records both jednočasno and jednovrěmenno with complementary branch profiles. Therefore 61 occurrences of the sanctioned jednovrěmenno family were retained, together with 14 nearby unreviewed forms. The method records this as unresolved corpus policy rather than silently flattening the distinction.

This correction illustrates why an evidence graph, held queue, and exact surface boundary are preferable to a scalar score or global search-and-replace.

8 Open work

The next substantial tranche is the correspondence family. The inventory contains 398 occurrences, 58 distinct surfaces, and 89 affected files. These surfaces mix verbs, adjectives, adverbs, nouns, spelling variants, and likely malformed derivatives. Before execution, each surface needs a reviewed table covering part of speech, mathematical sense, target form, paired script, adverse or homograph risk, example contexts, and review status.

Additional context-review queues include simultaneity doublet policy, *vprašanj**, *slijedi/sledi*, *slučaj*, and *namreč/naime/totiz*. Held families such as *ređ*, *jednako*, *važi/važe*, *slučaj*, and ring terminology remain outside the authorized change surface.

9 Public status

This is a reproducible internal normalization and artifact-quality release. It is not a critical edition, native-speaker certification, community approval, peer review, or proof of mathematical source fidelity. The full Noether readers and editable bodies are working translations and should be checked against the German source control and source scans before scholarly reuse.

Corrections and additional evidence can be proposed through the project GitHub:
