

Authority page 1 — printed page 203

Authority: physical page 1 / printed page 203. The running journal header, folio, scanner edge, and lower border are copy matter and are not transcribed into the body; publication data remain recorded in control metadata.

The rubric, exact French title, byline, French abstract, source-printed English abstract, and opening of §1 were read from the IAS authority pixels. The English abstract printed in the source is retained verbatim as source matter; the standalone English layer separately translates the French abstract and then reproduces the printed English abstract, so the two are not silently conflated.

The source has $G_{S'}$, not G_S , at the congruence-completion loci on this page. The inherited TeX/PDF family repeatedly dropped the prime; those readings were rejected. No image crop was needed because title, prose, formula (i), and notation were semantically replayable.

Authority page 2 — printed page 204

Authority: physical page 2 / printed page 204. The journal header and folio are excluded from body transcription.

In the first extension diagram, both lower arrows originate at $G(F)$: the diagonal arrow labeled s points upward to E , and the vertical inclusion points upward to $G(\mathbb{A})$. This is recorded as `diagram_page2_splitting_source=G(F)_TO_E_AND_G(A)`. The inherited diagram reversed or mis-sourced both arrows and was rejected.

The completion and Proposition 1 end in $G_{S'}$; inherited copies omitting the prime were not followed. The two isomorphisms for E are represented with the source's leftward isomorphism relation. Semantic replay was safe; no raster crop was introduced.

Authority page 3 — printed page 205

Authority: physical page 3 / printed page 205. The journal header and folio are excluded from body transcription.

Both commutative diagrams and the directional isomorphisms in (2) were reconstructed semantically. In the definition of R , the terminal map is a right arrow labeled σ from $\oplus \mu_v$ to μ , recorded as $R_{\text{terminal_map}}=\text{DIRECT_SUM_MU_V_RIGHT_ARROW_SIGMA_TO_MU}$. The inherited TeX substituted an inclusion hook and was rejected.

The unusual printed punctuation “F et; pour chaque” in the opening of §3 is retained in the French layer rather than silently normalized. The translation follows the syntax while the present note identifies it as source punctuation. No image crop was needed.

Authority page 4 — printed page 206

Authority: physical page 4 / printed page 206. The journal header and folio are excluded from body transcription.

In diagram (3), the diagonal splitting arrow starts at $G(F)$ and rises to $\widetilde{G(\mathbb{A})}$, beside the vertical inclusion $G(F) \rightarrow G(\mathbb{A})$. This is recorded as `diagram_3_splitting_source=G(F)UP_TO_CENTRAL_EXTENSION`. The inherited arrow ran in the opposite direction.

The theorem and the problem are source-unnumbered, recorded as `theorem_problem_numbering=UNNUMBERED`. Inherited theorem/problem counters were rejected. Diagram (4) and the completion loci use the outside-S factor $G_{S'}$. All diagrams were safely replayed semantically; no crop was required.

Authority page 5 — printed page 207

Authority: physical page 5 / printed page 207. The running header, folio, and issue footer are copy matter and are excluded from the body.

The modular substitution is exactly $f(-z^{-1})$, recorded as `modular_substitution=f(-z-1)`; the inherited source truncated the exponent to $f(\hat{-z})$. The authority also reads $U(c) \subset G_{S'}$ and $L \subset G_{T'}$, not the unprimed groups used in the inherited TeX.

The final source line prints “ $\tau_1 = \tau_2$ deux relèvements”. That equality sign is preserved in both source and English layers. The continuation on page 208 (“the subgroup ... where $\tau_1 = \tau_2$ ” and then “if the germs ... are distinct”) strongly suggests a typographical slip for a separator such as “ τ_1, τ_2 ” or “ τ_1 et τ_2 ”; no silent emendation has been made. Diagram (5) was replayed semantically without a crop.

Authority page 6 — printed page 208

Authority: physical page 6 / printed page 208. The body includes the final argument, the session note, notes (1)-(5), and the full IHÉS address. The substantial blank remainder is recorded as boundary matter but not transcribed as prose. There is no received-date line.

The terminal fact is recorded as terminal_boundary=SESSION_NOTE_NOTES_1_TO_5_ADDRESS_BLANK_REMAINDER_EOF_NO_RECEIVED_LINE. The address is retained exactly as “Institut des Hautes Études scientifiques, 91440 Bures-sur-Yvette”. The page ends physically after that address and blank remainder. No crop was required.
