
Interlanguage and Mathematical Translation Methodology

Current public map and Noether R823 completion gate v4

Public working-method release, 18 July 2026

Classification. This record contains reproducible research and translation infrastructure. The Spanish gate result certifies declared scope, evidence, build, and render bindings. It is not native-language certification, peer review, mathematical proof checking, or a critical edition.

What the concept record contains

The record preserves interlanguage source baselines, weighted-automaton and terminology work, manager handoffs, Interslavic normalization evidence, Romance-language infrastructure, reusable scripts, and bounded production experiments. Actual author and series readers remain on their respective records.

Romance language or variety routes	61
Romance WordWeb concepts / senses	60 / 106
Reviewed Romance occurrence records	682
Spanish/French terminology crosswalk rows	194
Human intelligibility observations	0
R823 declared source/target units	81
Spanish cumulative pages	473
R823 v4 gate checks passed	35 of 35
Pinned candidate-derived page renders	473
Independent Spanish terminology witnesses	68

Romance v10 remains infrastructure

Romance v10 records 61 explicit routes, 60 concepts, 106 senses, 682 reviewed occurrences, a 194-row Spanish/French terminology crosswalk, and six bounded controlled-Romance tranches. It is not a completed Romance translation or an empirical intelligibility result. Fifty-three routes still have no source body, 33 senses have no accepted support, and the access grid contains no human observations or form promotions.

Noether R823 completion gate v4

The executable gate covers Papers 1–43, the long-form book title and Sections 1–31, both post-45 units, bibliography, notices, reviews, and books with Noether. The Spanish candidate passes all 35 checks against the exact verified German authority and current 473-page reader.

The gate verifies:

- authority, expanded-target, unit, and whole-document hashes;
- byte-exact parity-ledger reconstruction from 81 direct reviews;
- every evidence record and every declared support artifact;
- 101 terminology decisions, of which 68 have independent native Spanish TeX line witnesses with matching files, hashes, and line ranges;
- structural omission tripwires, a successful current build, and the recorded TeX dependency graph;
- a readable final audit bound into every unit evidence record;
- fresh 120-dpi Poppler derivation of all 473 candidate pages;
- normalized-pixel equality between that fresh render and all stored render evidence;
- a structured all-page review decision and final snapshot stability.

The adversarial replay additionally proves that target-only terminology citations, unpinned TeX lines, stale manifests, arbitrary rehashed images, stale review records, weak audit labels, and hand-edited parity output do not pass.

What the gate does not prove

A passing gate is evidence-integrity and completeness control, not a linguistic or mathematical oracle. It does not certify native Spanish quality, semantic perfection, peer review, or critical-edition status. The Spanish artifact is a source-reconciled working translation. Important passages should still be checked against the German authority and source scans. The French R823 lane is moving and is not certified by this Spanish result.

Public file map

Open `15_Noether_R823_Translation_Completion_Gate_v4_20260718.zip` for the specification, exact scripts, passing replay, audit records, and full 473-page render baseline. Open `14_Interlanguage_Romance_Methodology_v10_Evidence_20260718.zip` for the current Romance infrastructure and bounded production evidence.

The actual Spanish reader and editable body package are published at 10.5281/zenodo.21422620, under Noether concept DOI 10.5281/zenodo.20412587.
