

Voevodsky's Lectures on Motivic Cohomology 2000/2001

Pierre Deligne

Voevodsky's Lectures on Motivic Cohomology

Abstract

These lectures cover several important topics of motivic homotopy theory which have not been covered elsewhere. These topics include the definition of equivariant motivic homotopy categories, the definition and basic properties of solid and ind-solid sheaves and the proof of the basic properties of the operations of twisted powers and group quotients relative to the A -equivalences between ind-solid sheaves.

1 Introduction

The lectures which provided the source for these notes covered several different topics which are related to each other but which do not in any reasonable sense form a coherent whole. As a result, this text is a collection of four parts which refer to each other but otherwise are independent. In the first part we introduce the motivic homotopy category and connect it with the motivic cohomology theory discussed in [7]. The exposition is a little unusual because we wanted to avoid any references to model structures and still prove the main theorem 2. We were able to do it modulo 6 where we had to refer to the next part. The second part is about the motivic homotopy category of $\mathcal{S}$ -schemes where $\mathcal{S}$ is a finite flat group scheme with respect to an equivariant analog of the Nisnevich topology. Our main result is a description of the class of A -equivalences (formerly called A -weak equivalences) given in Theorem 4 (also in Theorem 5). For the trivial group we get a new description of the A -equivalences in the non equivariant setting. In the third part we define a class of sheaves on $\mathcal{S}$ -schemes which we call solid sheaves. It contains all representable sheaves and quotients of representable sheaves by subsheaves corresponding to open subschemes. In particular the Thom P. Deligne e-mail: deligne@math.ias.edu N.A. Baas et al. (eds.), Algebraic Topology, Abel Symposia 4,

355 356 P. Deligne spaces of vector bundles are solid sheaves. The key property of solid sheaves can be expressed by saying that any right exact functor which takes open embeddings to monomorphisms is left exact on solid sheaves. A more precise statement is

Theorem 1 (6). *In the fourth part we study two functors. One is the extension to pointed sheaves of the functor from $\mathcal{S}$ -schemes to schemes which takes X to X_{solid} . The other one is extension to pointed sheaves of the functor which takes X to $X_{\text{solid}}^{\mathcal{S}}$ where $\mathcal{S}$ is a finite flat $\mathcal{S}$ -scheme. We show that both functors take solid sheaves to solid sheaves and preserve local and A -equivalences between termwise (ind-)solid sheaves. The material of all the parts of these notes but the first one was originally developed with one particular goal in mind – to extend non-additive functors, such as the symmetric product, from schemes to the motivic homotopy category. More precisely, we were interested in functors given by*

?

$\langle \rangle$ where $\mathcal{S}$ is a finite flat group scheme, $\mathcal{S}$ is a finite flat $\mathcal{S}$ -scheme and any $\mathcal{S}$ -scheme of finite type. The equivariant motivic homotopy category was introduced to represent $\langle \rangle$ as a composition $\langle \rangle \circ \langle \rangle$ and solid sheaves as a natural class of sheaves on which the derived functor $L\langle \rangle$ coincides with $\langle \rangle$. In the present form these notes are the result of an interactive process which involved

all listeners of the lectures. A very special role was played by Pierre Deligne. The text as it is now was completely written by him. He also cleared up a lot of messy parts and simplified the arguments in several important places. Princeton, NJ, 2001. Vladimir Voevodsky

2 Motivic Cohomology and Motivic Homotopy Category

We will recall first some of last year results (see [7]).

2.1 Last Year

!

1.1 We work over a field which sometimes will have to be assumed to be perfect. The schemes over we consider will usually be assumed separated and smooth of finite type over k . We note their category. Three Grothendieck topologies on $\mathcal{C}$ will be useful: Zariski, Nisnevich and étale. For each of these topologies a

(!

!

(!

Voevodsky's Lectures on Motivic Cohomology 2000/2001 (!

/

357 ! /

/ / 1.2 The definition of the motivic cohomology groups of smooth over k has the sheaf on amounts to the data for smooth over k of a sheaf $\mathcal{F}$ on the small site $(\mathcal{C}_{\text{ét}}, \tau_{\text{ét}})$ (resp. $(\mathcal{C}_{\text{Zar}}, \tau_{\text{Zar}})$) of the open subsets of X (resp. of étale), with $\mathcal{F}$ functorial in X : a map $Y \rightarrow X$ induces $\mathcal{F}_Y \rightarrow \mathcal{F}_X$.

following form:

(a) One defines for each Z a complex of presheaves of abelian groups Z on $\mathcal{C}$. It is in fact a complex of sheaves for the étale topology, hence a fortiori for the Nisnevich and Zariski topology. For any abelian group A the same applies to Z . (b) The motivic cohomology groups of X with coefficients in A are the hypercohomology groups of the Z , in the Nisnevich topology:

(!

%

%

%

%

% % $H^i(X, A)$ %

%

%

For Z we will write simply $H^i(X, A)$. Motivic cohomology has the following properties:

J

1. The complex Z is zero for $i < 0$. For any i it lives in cohomological degree i . As a complex of Nisnevich sheaves it is quasi-isomorphic to Z for $i \geq 0$ and to G for $i < 0$. J 2. for any i .

3. For any i in one has

$H^i(X, A) = \bigoplus_j H^j(X, A(j))$, where $A(j)$ is the j -th higher Chow group of cycles of codimension j . 4. In the étale topology, for ℓ prime to the characteristic of k , the complex Z

is quasi-isomorphic to D , giving for the étale analog of the formula $H^i(X, \mathbb{Z}(\ell)) = H^i(X, \mathbb{Z}) \otimes \mathbb{Z}(\ell)$. 1.3 The category $(=AB)$ is the category with objects separated schemes smooth of finite type over k , for which a morphism C is a cycle $C \in \mathcal{C}_0(X)$ on each of whose irreducible components C is finite over k and projects onto a connected component of X . A morphism C can be thought of as a finitely valued map from X to $\mathbb{A}^1$. For C , with residue field ℓ , it defines a zero cycle C on X , and the assumption made on C implies that the degree of this 0-cycle is locally constant on X . A morphism of schemes defines a morphism in $(=AB)$: the graph of f . This graph construction defines a faithful functor

from $(!)$ to the additive category $(=AB!)$. A presheaf with transfers is a contravariant additive functor from the category $(=AB!)$ to the category of abelian groups. The embedding of $(!)$ in

358 P. Deligne $(=AB!)$ allows us to view a presheaf with transfers as a presheaf on $(!)$ endowed with an extra structure. A sheaf with transfers (for a given topology on $(!)$, usually the Nisnevich topology) is a presheaf with transfers which, as a presheaf on $(!)$, is a sheaf. The Nisnevich and the étale topologies have the virtue that if $/$ is a presheaf with transfers, the associated sheaf $\gamma/$ carries a structure of a sheaf with transfers. This structure is uniquely determined by $/ \gamma/$ being a morphism of presheaves with transfers. For any sheaf with transfers

, one has
 $\gamma/ \text{Hom}/$
 Hom

(Hom of presheaves with transfers). All of this fails for the Zariski topology. The complexes Z (or γ) start life as complexes of sheaves with transfers.

% 1.4 A presheaf $/$ on $(!)$ is called homotopy invariant if $/ / A$. As the point of A defines a section of the projection of A to $*$, for any presheaf of abelian groups $/$, $/$ is naturally a direct factor of $/ A$; it follows that the condition “homotopy invariant” is stable by kernels, cokernels and extensions of presheaves. The following construction is a derived version of the left adjoint to the inclusion

$A(AA, \dots)$. (a) For a finite set, let Δ be the affine space freely spanned (in the sense of barycentric calculus) by $*$. Over $\mathbb{C}$, or $\mathbb{R}$, Δ contains the standard topological simplex spanned by $*$. The schemes Δ^n form a cosimplicial scheme. (b) For $/$ a presheaf, $\Delta/$ (the “singular complex of $/$ ”) is the simplicial presheaf $\Delta/ / 0$. Arguments imitated from topology show that for $/$ a presheaf of abelian groups, the cohomology presheaves of the complex $\Delta/$, obtained from $\Delta/$ by taking alternating sum of the face maps, are homotopy invariant. If $/$ has transfers so do the $\Delta/$ and hence the $\Delta/$. A basic theorem proved last year is:

Theorem 2 (1). *Let $/$ be a homotopy invariant presheaf with transfers over a perfect field with the associated Nisnevich sheaf $\gamma/$. Then the presheaves with transfers $\gamma/$ are homotopy invariant as well.*

The particular case of this theorem for $\gamma/$ claims the homotopy invariance of the sheaf with transfers $\gamma/$. Last year, the equivalence of a number of definitions of Z was proven. Equivalence means: a construction of an isomorphism in a suitable derived category, implying an isomorphism for the corresponding motivic cohomology groups. For our present purpose the most convenient definition is as follows.

$\gamma/$

Let Z be the sheaf with transfers represented by $(\text{on the category } (=AB!))$. We set $\gamma/$ for $J Z$ $\gamma/ A Z$ γ/ A for and $Z = \gamma/$.

2.2 Motivic Homotopy Category

A

The motivic homotopy category (pointed A -homotopy category of $\gamma/$), A for a finite dimensional noetherian scheme, will be the category deduced from a category of simplicial sheaves by two successive localizations. One starts with the category of schemes smooth over $*$, with the Nisnevich topology, and the category of pointed simplicial sheaves on $*$. For any site S (for instance $*$), there is a notion of local equivalence of (pointed) simplicial sheaves. It proceeds as follows:

(
(

(a) A sheaf defines a simplicial sheaf maps the identities. The functor

$\mathcal{H}om$
 $\mathcal{H}om$
 $($
 with all and all simplicial has a left adjoint :
 $\mathcal{H}om$
 The sheaf can be described as the equalizer of sheaf associated to the presheaf
 $\mathcal{H}om$
 $\mathcal{H}om$
 $\mathcal{H}om$ / , as well as the
 The same holds in the pointed context. We will often write simply for . is a simplicial sheaf, and u a section of over , one also disposes of (b) If sheaves u over : the sheaves associated to the presheaves

$\mathcal{H}om$
 $\mathcal{H}om$
 $\mathcal{H}om$
 $\mathcal{H}om$ / $\mathcal{H}om$ u /
 (c) A morphism is a local equivalence, if it induces an isomorphism on as well as, for any local section u of , an isomorphism on all . This applies also to pointed simplicial sheaves: one just forgets the marked point.

$\mathcal{H}om$
 $\mathcal{H}om$ (($\mathcal{H}om$
 One defines as the category derived from the category of pointed simplicial sheaves on . by formally inverting local equivalences. Until made more concrete, this definition could lead to set-theoretic difficulties, which we leave the reader to solve in its preferred way. 1

In the Appendix we have assembled the properties of “localization” to be used in this talk and in the next.

360 P. Deligne (

For a pointed sheaf on , Proposition 7 applies to tion by local equivalences: one has

and to the localiza-

$\mathcal{H}om / \mathcal{H}om / \mathcal{H}om$ / (0.1)

Definition 3 (1). An object of $\mathcal{H}om$ (is called $\mathcal{H}om$ -local if for any simplicial sheaf , one has $\mathcal{H}om^*$
 $\mathcal{H}om^*$
 $\mathcal{H}om^*$ $\mathcal{H}om$ $\mathcal{H}om$

At the right hand side, $\mathcal{H}om$ means that in the product, $\mathcal{H}om$ is contracted to a point, the new base point.

Proposition 4 (1). For a pointed sheaf on if and only if is homotopy invariant.

(, the simplicial sheaf

is $\mathcal{H}om$ -local

$\mathcal{H}om$, so that by (0.1) “ $\mathcal{H}om$ -local” means that

Proof. We have $\mathcal{H}om$ for any pointed sheaf , one has

A $\mathcal{H}om$ A morphism can be viewed as the data, for each . , of . , functorial in and marked point going to marked point. A morphism can similarly be described as data for . of . A . A Homotopy invariance hence implies $\mathcal{H}om$ -locality. The converse is checked by taking for the disjoint sum of a representable sheaf and the base point.

□

Definition 5 (2). (1) A morphism in $\mathcal{H}om$ (is an $\mathcal{H}om$ -equivalence if for any $\mathcal{H}om$ -local , one has in $\mathcal{H}om$ ($\mathcal{H}om$

Hom

Hom (2) The category $\mathcal{A}\mathcal{A}$ (is deduced from $\mathcal{A}$ (by formally inverting Hom
 $\mathcal{A}$ -equivalences.

Remark 6 (1). If a morphism in $\mathcal{A}$ (becomes an isomorphism in $\mathcal{A}\mathcal{A}$ (it is an $\mathcal{A}$ -equivalence. Indeed, if in $\mathcal{A}$ (is $\mathcal{A}$ -local, an application of Proposition 7 shows that for any $\text{Hom}^* \text{Hom}^* \mathcal{A}$
 $\mathcal{A}$ ($\mathcal{A}\mathcal{A}$ (which is bijective. If in Hom^* has an image in Hom^* is an isomorphism, it follows that for any $\mathcal{A}$ -local Hom^* Such an Hom^* is an $\mathcal{A}$ -equivalence.

Example 7 (1). Arguments similar to those given before show that if $\mathcal{A}$ is a homotopy invariant pointed sheaf, then for any simplicial pointed sheaf $\mathcal{B}$, one has

$\mathcal{A} / \text{Hom}^* (\mathcal{B} / \text{Hom} / \mathcal{A})$ in particular, if $\mathcal{A}$ is smooth over $\mathcal{B}$ and if $\mathcal{B}$ is the disjoint union of $\mathcal{B}_0$ and of a base point, Hom^*

$\mathcal{A}$

$\mathcal{A}$

2.3 Derived Categories Vs. Homotopy Categories

<

For any topos $\mathcal{A}$, which for us will be the category of sheaves on some site $\mathcal{C}$, the pointed homotopy category as well as the derived category are

obtained by localization. For the derived category, one starts with the category of complexes of abelian sheaves. The subcategory of complexes living in homological degree n is naturally equivalent, by the Dold Puppe construction, to the category of simplicial sheaves of abelian groups. The equivalence is

$\mathcal{A}$

$\mathcal{E}$

) simplicial /

complex

(

!LB> >

We will write $\mathcal{D}(\mathcal{A})$ for the inverse equivalence. For a point $\ast$, and an abelian group G , $\mathcal{D}(\mathcal{A})$ is indeed the Eilenberg–MacLane space $K(G, n)$. For a complex C not assumed to live in homological degree n , we define

$\mathcal{D}(\mathcal{A})$

$\mathcal{D}(\mathcal{A})$

=

= $G =$ where $G =$ is the subcomplex in $\mathcal{D}(\mathcal{A})$ of the form $\mathcal{D}(\mathcal{A})$

=

=

!LB-

$\mathcal{D}(\mathcal{A})$ is right adjoint to the inclusion functor $\mathcal{D}(\mathcal{A}) \rightarrow \mathcal{D}(\mathcal{A})$ all complexes so that $\mathcal{D}(\mathcal{A})$ form a pair of adjoint functors: simplicial abelian sheaves complexes of sheaves

Theorem 8 (2). Assume that $\text{Spec} \mathcal{A}$ is perfect. Then, for $\mathcal{A}$ a presheaf with transfers, and as above, and $\mathcal{D}(\mathcal{A})$, $\text{Hom}^* \mathcal{D}(\mathcal{A})$, $H^* \mathcal{D}(\mathcal{A})$. = / Note that

$\mathcal{A}$

/, /

In this theorem $\mathcal{D}(\mathcal{A})$ is the simplicial sheaf of abelian groups whose normalized chain complex is in homological degree n . To prove the theorem we establish the chain of equalities,

$$\cdot = / \text{Hom}^* = / , \text{Hom}^* = / , \text{Hom}^* / , H$$

A

(1.1)

A

the first equality is proved right before Proposition 4, the second right after Proposition 5 and the last one follows from Lemma 1. be the forgetting functor from abelian sheaves to sheaves of sets. Its Let left adjoint is Z : the sheaf associated to the presheaf

$/$

Let be a sheaf and be deduced from by adjunction of a base point. We also write and for the corresponding “constant” simplicial sheaf. One has

$\mathcal{A}(\mathcal{C})$ is the group of $\mathcal{C}$ -valued simplicial presheaves on $\mathcal{C}$, the group $\mathcal{A}(\mathcal{C})$ is which now occurs at the right-hand side of (3.1) can be interpreted as hypercohomology of $\mathcal{C}$ viewed as a space, i.e. in the topos of sheaves over $\mathcal{C}$. For $\mathcal{C}$ defined by an object of the site $\mathcal{C}$, this is the same as hypercohomology of the site $\mathcal{C}$. As we do not want to assume $\mathcal{C}$ is bounded below (in cohomological numbering), checking this

requires a little care. For a complex of sheaves over a site $\mathcal{C}$, not necessarily bounded below, H can be defined as the Hom group in the derived category $D(\mathcal{C})$. For $\mathcal{C}$ in a topos and the topos $\mathcal{C}$ viewed as a space, besides the morphism

$$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C})$$

of toposes $\mathcal{C} \rightarrow \mathcal{C}$, i.e. the adjoint pair $\mathcal{C} \rightleftarrows \mathcal{C}$, we have for abelian sheaves an adjoint pair $\mathcal{C} \rightleftarrows \mathcal{C}$, with $\mathcal{C}$ and $\mathcal{C}$ both exact. By Proposition 8, $\mathcal{C} \rightleftarrows \mathcal{C}$ induce an adjoint pair for the corresponding derived categories. As $\mathcal{C} \rightarrow \mathcal{C}$, we get (3.2) $\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$

hence

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$ (3.3) Let us consider the particular case of $\mathcal{C}$ with the Nisnevich topology. For any complex of sheaves, (3.3) gives for smooth over $\mathcal{C}$ $\mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$ (3.4) Here, $\mathcal{C}$ is the site $\mathcal{C}$ with the Nisnevich topology. It has however the same hypercohomology as the small Nisnevich site $\mathcal{C}$. Indeed, one has a morphism $\mathcal{C} \rightarrow \mathcal{C}$ and the functors $\mathcal{C}$ and $\mathcal{C}$ are exact. One again applies Proposition 8. If we apply (3.4) to a translate (shift) of $\mathcal{C}$, we get (3.5) $\mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$ Applying (3.5) to $\mathcal{C} \rightarrow \mathcal{C}$ we get the first equality in (1.1).

Proposition 11 (4). Let $\mathcal{C}$ be a complex of abelian sheaves on $\mathcal{C}$. The following $\mathcal{A}(\mathcal{C})$ conditions are equivalent:

1. $\mathcal{C}$ is $\mathcal{A}$ -local. $\mathcal{C}$, the functor H is homotopy invariant.
2. For $\mathcal{C}$, one has in the derived category
3. For any complex in cohomological degree n

$$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$$

$$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$$

Proof. By Proposition 3, condition (1) can be rewritten: for any pointed simplicial sheaf $\mathcal{C}$.

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$ The operation $\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C})$ is better written as a smash product $\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C})$

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$ It follows that with $\mathcal{A}$. For pointed sets and $\mathcal{C}$, $\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$

(isomorphisms of simplicial sheaves), hence

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$ It follows that (1) is the particular case of (3) for of the form $\mathcal{A}(\mathcal{C})$. Similarly, (2) is the particular case of (3) for of the form $\mathcal{C}$, with $\mathcal{C}$ of a simplicial pointed sheaf is its smash product with The suspension the simplicial sphere (the n -simplex modulo its boundary). It follows that

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$

$\mathcal{A}(\mathcal{C}) \rightarrow \mathcal{A}(\mathcal{C}) = H \rightarrow \mathcal{C} =$

(isomorphism of simplicial sheaves), and by Eilenberg–Zilber, the normalized complex $\mathcal{C}$ is homotopic to the tensor product of the normalized complexes of $\mathcal{A}(\mathcal{C})$ and $\mathcal{C}$. The latter is simply $\mathcal{C}$:

$$\begin{aligned} & \rightarrow \Sigma^{-1} H^0(X, \mathcal{F}) \\ & \rightarrow \Sigma^{-1} H^0(X, \mathcal{F}) \end{aligned}$$

This is just a high-brown way of telling that the reduced homology of a suspension is just a shift of the reduced homology of the space one started with. Applying this to $\Sigma^{-1} H^0(X, \mathcal{F})$, one obtains that (1)(3). Indeed, $\Sigma^{-1} H^0(X, \mathcal{F})$ is homotopic to $\Sigma^{-1} H^0(X, \mathcal{F})$. We now prove that (2)(1). For a complex, let (*) be the statement that the conclusion of (3) holds for all $\mathcal{F}$. The assumption (2) is that (*) holds for reduced to $\Sigma^{-1} H^0(X, \mathcal{F})$ in degree n , and we will conclude that it holds for all in cohomological degree by “devissage”:

$$\begin{aligned} & \rightarrow \Sigma^{-1} H^0(X, \mathcal{F}) \\ & \rightarrow \Sigma^{-1} H^0(X, \mathcal{F}) \end{aligned}$$

9

, in degree zero, follows from Corollary 10. (a) The case of a sum of $\Sigma^{-1} H^0(X, \mathcal{F})$ and that (*) holds (b) Suppose that is bounded, is in cohomological degree for all n .

The functors

$$A_n = A_n(\Sigma^{-1} H^0(X, \mathcal{F}))$$

(3.6)

are contravariant cohomological functors, hence give rise to convergent spectral sequences

One has a morphism of spectral sequences

for for which is an isomorphism for $n \geq 0$, and both vanish for $n < 0$, J or n large. It

follows that for $\mathcal{F}$, i.e. that satisfies (*). The same argument can be expressed as an induction on the number of $\mathcal{F}$ such that

" . If $\mathcal{F}$ is the largest (with $\mathcal{F}$), the induction assumption applies to $\Sigma^{-1} H^0(X, \mathcal{F})$, even to $\Sigma^{-1} H^0(X, \mathcal{F})$, and one concludes by the long exact sequence defined by $\Sigma^{-1} H^0(X, \mathcal{F})$

(c) Expressing as the inductive limit of the and using Proposition 11, one sees that we need not assume that is bounded. is a quasi-isomorphism, $\Sigma^{-1} H^0(X, \mathcal{F})$ is one too (d) If (flatness of $\Sigma^{-1} H^0(X, \mathcal{F})$), and (*) holds for if and only if it holds for $\Sigma^{-1} H^0(X, \mathcal{F})$. For instance, (e) Any abelian sheaf is a quotient of a direct sum of sheaves $\Sigma^{-1} H^0(X, \mathcal{F})$ the sum over $\mathcal{F}$, of $\Sigma^{-1} H^0(X, \mathcal{F})$ mapping to by $\Sigma^{-1} H^0(X, \mathcal{F})$. It follows that admits a resolution by such sheaves. By (a) and (c), satisfies (*). It follows from (d) that satisfies (*) and then by (c) that any complex in degree satisfies (*).

& & :

&

□

2.3 Application to Presheaves with Transfers

/

Let $\mathcal{F}$ be a presheaf with transfers. A formal argument [7] shows that the presheaves with transfers are homotopy invariant. By the basic result (Theorem 1) recalled in the first lecture, it follows that for any $\mathcal{F}$, one has

$$\begin{aligned} & = \Sigma^{-1} H^0(X, \mathcal{F}) \\ & = \Sigma^{-1} H^0(X, \mathcal{F}) \\ & H \\ & A = \Sigma^{-1} H^0(X, \mathcal{F}) \\ & (4.1) \end{aligned}$$

Indeed, as $\mathcal{F}$ and A are of finite cohomological dimension, both sides are abutment of a convergent spectral sequence

$$= \Sigma^{-1} H^0(X, \mathcal{F}) = \Sigma^{-1} H^0(X, \mathcal{F}) \text{ and the same for } A. \text{ By Theorem 1 applied to } \Sigma^{-1} H^0(X, \mathcal{F}), = \Sigma^{-1} H^0(X, \mathcal{F})$$

366 P. Deligne

is the same for or for Proposition 4((2)(1)) that

Proposition 12 (5). *For*

, is A -local.

A. Applying (3.5), we conclude from

! perfect, if $/$ is a presheaf with transfers, for all $„ = /$

Combining Proposition 5 with Proposition 7 we get the second equality in (1.1).

2.5 End of the Proof of Theorem 2

=

For any pointed simplicial sheaf $\mathcal{F}$, is a pointed bisimplicial sheaf of which one can take the diagonal $\mathcal{F}$. For any pointed sheaf $\mathcal{G}$, one has a natural map $\mathcal{F} \rightarrow \mathcal{G}$, and for a pointed simplicial sheaf $\mathcal{H}$, those maps for the induce

=

$0 =$

Proposition 13 (6). *The morphism*

γ

$0 =$

γ

$0 =$ is an A -equivalence.

Proof. We deduce Proposition 6 from Proposition 20.

The two maps

A are equalized by A , hence

become equal in the A -homotopy category. If two maps of pointed simplicial sheaves factor as A , they also become equal. By

the adjunction of A and of A , such a factorization can be rewritten as

$/$

$/$

$/$

$/$

$/$

$/$

$/ = A($

$/ =$ Particular case: the maps $=$, become equal in the homotopy category.

Evaluated on $\mathcal{F}$, these maps are the restriction maps A .

The affine space A is homotopic to a point in the sense that $A \xrightarrow{A} A$ interpolates between the identity map (for $\mathcal{F}$) and the constant map (for $\mathcal{F}$). The map induces

$A \xrightarrow{A} A$ and, composing with $\mathcal{F}$, in A , we obtain that A

A the identity map, and the map induced by A

A , are equal in the A -homotopy category. The map of simplicial sheaves is hence an A -equivalence. It has as inverse in the A -homotopy category the map induced by

$=$

Spec!

A and one applies Remark 1. We now apply Proposition 20 to the bisimplicial sheaves

$= 0$. For fixed $\mathcal{F}$, this is just

A ,

and to the natural map and Proposition 20 gives Proposition 6.

To prove the last equality in (1.1), it suffices to show that:

$/, /, = /$.

□

Lemma 14 (1). *For any abelian sheaf lence from to*

$/$,

This construction can be sheafified, and can be applied termwise to a simplicial sheaf of monoids, leading to a pointed bisimplicial sheaf of which one can take the diagonal

$$0 \\ 0 =$$

This construction commutes with the construction $\mathcal{A}$. Indeed, $\mathcal{A}$ is naturally isomorphic to $\mathcal{A}$, the operation commutes with products, and $\mathcal{A}$ and $\mathcal{A}$

are both diagonals of the trisimplicial pointed sheaf $\mathcal{A}$. For abelian simplicial sheaves, the operation gives again abelian simplicial

sheaves, hence can be iterated, and $\mathcal{A}$ commutes with Via Dold–Puppe construction, corresponds, up to homotopy, to the shift of complexes:

$$= \\ 0 = \\ 0 = \\ = \\ 0 = \\) \\)$$

This can be viewed as an application of the Eilenberg–Zilber Theorem (see [9, Theorem 8.5.1]): one has

$$) \\ \text{Tot}$$

(Eilenberg–Zilber),

and for each n , the normalization of $\mathcal{A}$ is just $\mathcal{A}$, so that the double complexes $\mathcal{A}$ and $\mathcal{A}$, otherwise, have homotopic $\mathcal{A}$. If $\mathcal{A}$ is an abelian simplicial sheaf, applying Proposition 6 to $\mathcal{A}$, we obtain that

$$, \\ 0 = \\ 0 = \\ < \mathcal{A} \\ (6.1)$$

is an $\mathcal{A}$ -equivalence. The functor transforms chain homotopy equivalences into simplicial equivalences. For any simplicial abelian group (to be or $\mathcal{A}$), we hence have a simplicial homotopy equivalence

$$0 = \\)) ,$$

Simplicial homotopy equivalences being $\mathcal{A}$ -equivalences, we conclude that (6.1) induces an $\mathcal{A}$ -equivalence

$$) , \\) 0 = ,$$

□

2.6 Appendix: Localization

$\mathcal{A}$ be a category and $\mathcal{A}$ be a set of morphisms of $\mathcal{A}$. The localized category $\mathcal{A}[\mathcal{A}^{-1}]$ is deduced from $\mathcal{A}$ by “formally inverting all $\mathcal{A}$ ”. With this definition, it is clear that one has a natural functor $\text{MA} : \mathcal{A} \rightarrow \mathcal{A}[\mathcal{A}^{-1}]$, bijective on the set of objects, and that for any category $\mathcal{E}$, $\mathcal{A} / \mathcal{A} \rightarrow \text{MA} \text{ Hom} = \mathcal{E} \text{ Hom} = \mathcal{E}$ is a bijection from $\text{Hom} = \mathcal{E}$ to the set of functors from $\mathcal{A}$ to $\mathcal{E}$ transforming morphisms in $\mathcal{A}$ into isomorphisms. Let

If one remembers that the categories form a 2-category, and if one agree with the principle that one should not try to define a category more precisely than up to equiv given alence (unique up to unique isomorphism), the universal property of above is doubly unsatisfactory. The easily checked and useful universal property is

the following: $\mathcal{A}$ is an equivalence from the category to the full subcategory of consisting of the functors which map to isomorphisms.

$$\begin{aligned} & / \\ & / \text{MA } \mathcal{A}(= \mathcal{E} \\ & = \mathcal{A}(= \mathcal{E} / \end{aligned}$$

in $=$ is such that the functor $* \text{L} \& \text{Hom} \mathcal{Q} \text{X} =$ transforms maps in into bijections, then

and , one has a

-Schemes

-Schemes

We fix a base scheme , supposed to be separated noetherian and of finite dimension; fiber product K will be written simply as . We also fix a group scheme over , supposed to be finite and flat. We note - the representable sheaf defined by . Let be the category of schemes quasi-projective over , given with an action of . Any in admits an open covering by affine open subschemes which are -stable. This makes it possible to define a reasonable quotient in the category of schemes over (rather than in the larger category of algebraic spaces). For each , is defined as the spectrum of the equalizer

[
[

O and is obtained by gluing the . It is a categorical quotient, i.e. the coequalizer of . The map is finite, open, and the topological space is the coequalizer of the map of topological spaces . One can show that is again quasi-projective. Remark 2 below shows that this fact, while convenient for the exposition, is irrelevant. One defines on [a pretopology [3, II.1.3] by taking as coverings the family of etale maps with the following property: admits a filtration by closed equivariant subschemes $\#$ such that for each $+$, some map has a section over . The Nisnevich topology on [is the topology generated by this pretopology. The category [with the Nisnevich topology is the Nisnevich site [. . O

Remark 21 (1). The corresponding topos is not the classifying topos of [2, IV.2.5]. A morphism can become a Nisnevich covering after forgetting the action of , and not be a Nisnevich covering. Example: $\mathrm{Spec} \ , \mathbb{Z} \ , \ ,$ and permutes two copies of in .

!

Remark 22 (2). Let affine . be the site defined as above, with “quasi-projective’ replaced by “affine’. It is equivalent to . , in the sense that restriction to affine . is an equivalence from the category of sheaves on . to the category of sheaves on affine . .

[
[
L

Remark 23 (3). If π_1 is the trivial group, the definition given above recovers the usual Nisnevich topology. For π_1 , the condition usually considered: “every point of X is the image of a point with the same residue field of some U ”, is indeed equivalent to the condition imposed above. This is checked by noetherian induction: if a generic point of X can be lifted to U , some open neighborhood of x can be lifted to U , and one applies the induction hypothesis to $X \setminus U$.

L

3

3

We write $[_]$ for the category of quasi-projective schemes over k , with the Nisnevich topology.

$\{U_i\}$ is a covering of X in $[_]$, there is a U in $[_]$ whose pull-back to X is finer than $\{U_i\}$ as in the definition of the Nisnevich

Proof. Fix a filtration $\{X_i\}$ of X by closed subschemes. We write π_i for the quotient map $X_i \rightarrow X$. For $i \geq 1$, $X_i \setminus X_{i-1}$ is in some U_i , by equivariance of the π_i , and one of the maps

π_i has an equivariant section s_i over U_i . Let π_i^* be the henselization of π_i at x . The map π_i^* being finite, the pull-back of s_i to π_i^* is the coproduct of the π_i^* for $i \geq 1$. The map from π_i^* to π_i being étale, the section s_i , restricted

to $X_i \setminus X_{i-1}$, extends uniquely to a section (automatically equivariant) of π_i^* over

$X_i \setminus X_{i-1}$. Writing X_i as the limit of étale neighborhoods of $X_i \setminus X_{i-1}$, one finds that X_i has an étale neighborhood U_i such that U_i has an equivariant section over $X_i \setminus X_{i-1}$. The U_i form the required covering V .

We define the π_1 -local henselian schemes to be the schemes obtained in the following way. For $x \in X$, let U_x be a point of X , and N_x the henselization of X at x . As N_x is finite over X , this fiber product is a finite disjoint union of local henselian schemes, and π_1 -local henselian schemes are simply the π_1 -equivariant finite disjoint unions of local henselian schemes, for which π_1 is local. $\square$

Lemma 24 (2). *If U covering V of*

is π_1 -local henselian, the functor $A(_)$ is a $[_]$, i.e. it defines a morphism of the punctual site $\text{Sets} [_]$. N , the corresponding fiber functor is $/ AM^(_)$ N , the colimit being taken over the étale neighborhoods of x in N . The collection of fiber functors so obtained is conservative.*

Proof. The functor $A(_)$ commutes with finite limits. It follows from $\square$

Lemma 2 that it transforms coverings into surjective families of maps, hence is a morphism of sites $L\& [_]$.

Proposition 25 (13). *If point of the site to $[_]$. If*

To check that the resulting set of fiber functors is conservative, it suffices to check that a family of étale is a covering if for any π_1 -local henselian X ,

$A(_)$

is onto. The proof, parallel to that of Lemma 2 is left to the reader.

3.2 The Brown–Gersten Closed Model Structure on Simplicial Sheaves on π_1 -Schemes We recall that a commutative square of simplicial sets (or pointed simplicial sets)

(13.1)

)

is homotopy cartesian (or a homotopy pull-back square) if, when

)

weakly equivalent to it and mapping to by (Kan) fibration: map from to is a weak equivalence.

.

/

[

Definition 26 (3). A simplicial presheaf on $\mathcal{C}$ is flasque if tractible and if for any (upper) distinguished square:

is replaced by

$\mathcal{C}$, the

$\mathcal{C}/\#$ is con-

$\mathcal{C}$

$(\mathcal{C}, - \text{ etale}, + \text{ open embedding}, \mathcal{C}, \mathcal{C}$ and $\mathcal{C}$), the square $\mathcal{C}/\mathcal{C}$

$\mathcal{C}/\mathcal{C}$

is homotopy cartesian.

$\mathcal{C}/\mathcal{C}/\mathcal{C}/\mathcal{C}$

Theorem 27 (3). *Let*

be a morphism of flasque simplicial presheaves.

If the induced morphism of simplicial sheaves is a local equivalence,

then, for any $\mathcal{C}$ in $\mathcal{C}$, is a weak equivalence.

$\mathcal{C}/\mathcal{C}$

$\mathcal{C}/\mathcal{C}/\mathcal{C}/\mathcal{C}$

Proof. For a $\mathcal{C}$ -scheme let $\mathcal{C}$ be the small Nisnevich site of $\mathcal{C}$ and for a presheaf on $\mathcal{C}$ let $\mathcal{C}$ be the restriction of $\mathcal{C}$ to $\mathcal{C}$. Our assumption that

$\mathcal{C} \rightarrow \mathcal{C}$ is a local equivalence implies that $\mathcal{C} \rightarrow \mathcal{C}$ is a local equivalence defines a morphism of sites $\mathcal{C} \rightarrow \mathcal{C}$. The map $\mathcal{C} \rightarrow \mathcal{C}$ and $\square$

Lemma 2 implies that the direct image functor commutes with the associated sheaf functor and takes local equivalences to local equivalences. Therefore the morphism $\mathcal{C} \rightarrow \mathcal{C} \rightarrow \mathcal{C}$ is a local equivalence. The presheaves

and are flasque on $\mathcal{C}$ and by [8, Lemma 3.1.18] we conclude that $\mathcal{C} \rightarrow \mathcal{C}$

$\mathcal{C}/\mathcal{C}$

$\mathcal{C}, \mathcal{C}/\mathcal{C}, \mathcal{C}/\mathcal{C}$

$\mathcal{C}/\mathcal{C}$,

$\mathcal{C}$

$\mathcal{C}/\mathcal{C}$,

$\mathcal{C}, \mathcal{C}/\mathcal{C}$

$\mathcal{C}/\mathcal{C}$

$\mathcal{C}, \mathcal{C}/\mathcal{C}, \mathcal{C}/\mathcal{C}$

is a weak equivalence.

In [1], Brown and Gersten define a simplicial closed model structure on the category of pointed simplicial sheaves on a Noetherian topological space of finite dimension. As in Jardine [11], the equivalences are the local equivalences. The homotopy category is hence the same as Joyal's, but the model structure is different: less cofibrations, more fibrations. The arguments of [1] work as well in the Nisnevich topology, for the big as well as for the small Nisnevich site, or for $\mathcal{C}$, once Theorem 3 is available.

We review the basic definitions, working in $\mathcal{C}$ be the sub. $\mathcal{C}$. Let

simplicial set of $\mathcal{C}$, union of all faces but the n -th face. For $\mathcal{C}, \#$. One takes as generating trivial cofibrations the maps of the form :

$\mathcal{C}$

$\mathcal{C} \rightarrow 0$

!

$\mathcal{C}$

$\mathcal{C}/\mathcal{C} \rightarrow \mathcal{C} - \mathcal{C}; \mathcal{C}$ for an open embedding, $0 >$

$\mathcal{C} -$

$\mathcal{C} \rightarrow \mathcal{C}$

$\mathcal{C} \rightarrow \mathcal{C}$;

0 - ,

One then defines the fibrations to be the morphisms having the right lifting property with respect to generating trivial cofibrations (see, e.g. [5]), the (weak) equivalences to be the local equivalences, the trivial fibrations to be fibrations which are also (weak) equivalences, and the cofibrations to be the morphisms having the left lifting property with respect to trivial fibrations. Following [1] and using Theorem 3, one proves that the trivial fibrations can be equivalently described as morphisms having the right lifting property with respect to the following class of morphisms :

P

$P \# \rightarrow 0 \rightarrow P \%$ for open embedding, $0 \rightarrow$ The maps of the form

$\wedge \%$

$\rightarrow 0 \rightarrow$

$0 \rightarrow$

P are called generating cofibrations.

376 P. Deligne For and pointed simplicial sheaves, one defines a pointed simplicial set by A(0 Following [1], one sees that the classes of cofibrations, (weak) equivalences, fibrations, and are a simplicial closed model structure in the sense of [1]. This has the following consequences.

Corollary 28 (14). *If is cofibrant and fibrant, for any pointed simplicial set has in the relevant homotopy categories*

Proposition 45 (22). *For a pointed simplicial sheaf, let be the n -th skeleton of , i.e. simplicial subsheaf of for which*

is the union of the images of the degeneracies . One has push-out squares for

$>0 \mathcal{E}! ? B$

(22.1)

$0 \mathcal{E}! ? B$ Let now $/$ be bisimplicial. Each $/$ is simplicial, and they form a simplicial system of pointed simplicial sheaves. Let us apply $? B$ and $\mathcal{E}!$ to the first variable, i.e. to the simplicial sheaf $/$ for each fixed (. We again have diagrams (22.1) and, taking the diagonal 0, one obtains push-out squares: $/ >0 0\mathcal{E}! ? B/$

(22.2)

$/ 0 0\mathcal{E}! ? B/$ where $/$ now stands for the pointed simplicial sheaf $/$. This way the simplicial sheaf $0 ? B/$, which by Lemma 8 maps to $0/$ by a local equivalence, appears as an inductive limit of (22.2).

Proof of Proposition 20: With the notations of 22 it suffice to show that the

$0 \mathcal{E}! ? B / 0 \mathcal{E}! ? B \mathcal{E}! ? B \$ \$ 0 \mathcal{E}! ? B / \$ \$$
 (with applied in the first variable) are A -equivalences. We prove it by induction on . For , ,
 and is assumed to be an A equivalence. From to , we have a morphism of push out squares

$$\begin{array}{ccc} & & \\ & & \\ & & \\ (22.2) \text{ for} & & \\ (22.2) \text{ for} & & \\ / \text{ is an } A\text{-equivalence, by Lemma 6, so are its smash product with } >0 \text{ and } 0 . \text{ It remain to} \\ \text{apply the As} \end{array}$$

Lemma 46 (9). Suppose given a morphism of push out squares

$$\begin{array}{ccc} 1 & 2 & \\ 3 & & \\ 1 & & \\ 2 & & \\ 3 & & \\ 4 & & \\ 4 & & \end{array}$$

 which is an A -equivalence in positions 1 2 and 3. If in each square the first vertical map is
 injective, then the morphism of squares is an A -equivalence in position 4 as well.

Proof. Replacing the push out squares by push out squares of local equivalent objects, we may
 and shall assume that all objects considered are cofibrant, and that the vertical maps are cofi-
 brant.

If is fibrant applying to each of the squares we get a morphism of cartesian squares, of pointed
 simplicial sets in which the vertical maps are cofibrations:

$$\begin{array}{ccc} 4 & 3 & \\ 4 & 3 & \\ 2 & 1 & \\ 2 & 1 & \end{array}$$

 If is in addition A -local, it is a weak equivalence in positions 1 2 and 3,
 hence also in position 4. By Lemma 7, this proves Lemma 9, finishing the proof of Proposition
 20 as well as of the claim that the class of A -equivalences is -closed.
 0

□

3.5 The Class of A -Equivalences as a -Closure In this section we finish the proof of Theorem
 4.

Proposition 47 (23). The homotopy push-out of a diagram

$$\begin{array}{ccc} [& \text{is the push-out} & \\ (23.1) & & \\ A \text{ of} & & \\ 5 & & \\ [& & \\ 5 (23.2) & & \\ 0 \text{ where the vertical map } 0 \rightarrow 0 \text{ is induced by } > > 0 & & \\ 0 \text{ mapping } 0 \text{ to (resp.) in } 0 . \text{ In the case of simplicial sets, } A \text{ maps to } 0 \text{ with fibers above} & & \\ , \text{ above } , \text{ and above } . \text{ The homotopy push-out } A \text{ is the diagonal of the bisimplicial object with} & & \\ \text{columns } 5 \neq 5 \text{ obtained by formally adding degeneracies to} & & \\ 5 & & \\ 0^* 0 & & \\ > & & \end{array}$$

$\begin{array}{c} > \\ [\\ \end{array}$
in $\ast$ (cf. 21) [maps to , maps to]. If a morphism of diagrams (23.1), the induced morphism from A to
 $[$ *is*
 A is hence in
the closure of the three components of diagonal $(4(3), (4))$. A commutative square for the operation of finite coproduct and induces a morphism

Example 48 (1). Let

For a simplicial presheaf

392 P. Deligne

[

Proposition 58 (30). (Proof of Lemma 11) Let us say that $\mathcal{C}$ is connected if it is not empty
 and is not a disjoint union: $\mathcal{C}$ should act transitively on the set of connected components of $\mathcal{C}$. Let
 $\mathcal{C}_0$ be the full subcategory of connected objects. A sheaf on $\mathcal{C}$ is determined by its restriction to $\mathcal{C}_0$.
 Indeed,

. To apply Construction 29, we will use this remark to identify the category of sheaves on $\mathcal{C}$ to
 a full subcategory of the category of presheaves on $\mathcal{C}$. For any $\mathcal{F}$ as in Construction 29, the functor
 takes values in sheaves, that is in the restriction of sheaves to $\mathcal{C}_0$. Indeed, for $\mathcal{C}$ connected, $\mathcal{F}$ is the $\mathcal{C}$
 same, whether $\mathcal{F}$ and $\mathcal{G}$ are taken in the sheaf or in the presheaf sense.

$$\begin{array}{c} / \\ / / = = \\ = [[= \\ [\\ = \\ , \end{array}$$

Fix $\mathcal{F}$ as in Lemma 11. For each $\mathcal{C}$, the assumption on $\mathcal{F}$ ensures that $S/\mathcal{F}$ is in the 0-closure
 of the empty set, and similarly for $\mathcal{G}$. For each $\mathcal{C}$ (connected), the morphism of pointed simplicial
 sets $\mathcal{F} \rightarrow \mathcal{G}$

-closure of the empty set. It follows that $\mathcal{F}$ is a weak equivalence, hence in the 0 $\mathcal{F}^* / \mathcal{G}^*$: the
 5 over $\mathcal{C}$ of the $\mathcal{C} / \mathcal{D}$

-closure of the empty set. Iterating one finds the same for $\mathcal{F}^* / \mathcal{G}^*$ is in the 0
 $\mathcal{F}^* / \mathcal{G}^*$, and $S/\mathcal{F}$ is in this 0 -closure too. It remains to apply the two out of three property to
 $S/\mathcal{F}$

$\mathcal{F} / \mathcal{G}$ is a local equivalence and if the $\mathcal{F}$ and $\mathcal{G}$ are all of for $\mathcal{C}$ upper, then $\mathcal{F}$ is in the 0 -closure of
 the $\mathcal{A}$

Lemma 59 (12). *If the form $>$ distinguished.*

/

$P ;$ we have a morphism $aD aF$ and the map is isomorphic to the $a \text{ colim} D 2aD$ It remains to show that $aD aD$ is in ? . This morphism is of the form $P- / /$ where $is in ? .$ Using the fact that ? is closed for diagonals we reduce to the case $> .$ Using the same reasoning as above we further reduce to the case $> .$ Consider the class of such that $P-$ is in ? . This class clearly contains morphisms $A ,$ has the two out of three property and is closed under filtering colimits. It also

contains simplicial homotopy equivalences. It contains morphisms of the form $\mathcal{A} \rightarrow \mathcal{B}$ because such morphisms are For map

$\mathcal{A} \xrightarrow{+} \mathcal{B}$
 $\mathcal{A} \xrightarrow{\%} \mathcal{B}$
 $\mathcal{A} \xrightarrow{\sim} \mathcal{B}$ -homotopy equivalences.

3 Solid Sheaves

3.1 Open Morphisms and Solid Morphisms of Sheaves

We fix and repeated in
as in Sect. 3.1, and will work in

$(\mathcal{C}, \mathcal{D})$
 $\mathcal{C} \rightarrow \mathcal{D}$
 $[\mathcal{C}, \mathcal{D}]$. The story could be

Definition 63 (6). A morphism of sheaves is open if it is relatively representable by open embeddings, i.e. if for any morphism u (that is, u is

u in $[\mathcal{C}, \mathcal{D}]$), the fiber product $\mathcal{C} \times_{\mathcal{D}} \mathcal{C}$ mapping to $\mathcal{C}$ is isomorphic $\mathcal{C}$ -stable open subset of $\mathcal{C}$. $\mathcal{C}$ for a In other words: should identify $\mathcal{C} \times_{\mathcal{D}} \mathcal{C}$ with a subsheaf of $\mathcal{C}$ and, for any $\mathcal{E}$, there is open in $\mathcal{C}$ and $\mathcal{E}$ -stable such that the pull-back of $\mathcal{E}$ with respect to u is in $\mathcal{C}$ if and only if u maps to $\mathcal{C}$.

The property “open” is stable under composition. It is also stable by pull-back: if in a cartesian square

$$\begin{array}{ccc} & & \mathcal{C} \\ & \swarrow & \downarrow u \\ \mathcal{A} & \xrightarrow{\quad} & \mathcal{B} \end{array} \quad (32.1)$$

if $\mathcal{C}$ is open, then if $\mathcal{A}$ is open and u is an epimorphism, then $\mathcal{B}$ is open. Indeed,

Lemma 64 (14). For $\mathcal{C} \rightarrow \mathcal{D}$ a morphism, the property that $\mathcal{C}$ is represented by open in is local on (for the Nisnevich topology).

Proof. Suppose that the cover $\mathcal{C} \rightarrow \mathcal{D}$, and that each $\mathcal{C}_i \rightarrow \mathcal{D}$ is represented by $\mathcal{C}_i$. For $\mathcal{C} \rightarrow \mathcal{D}$, $\mathcal{C}/\mathcal{X} \rightarrow \mathcal{X}$ is then represented by $\mathcal{X}$ with $\mathcal{X}$ the inverse image of $\mathcal{C}$. By descent for open embedding, the come from some $\mathcal{U}$, we have locally on $\mathcal{U}$ an isomorphism $\mathcal{C} \xrightarrow{\sim} \mathcal{U}$ and by descent for

isomorphisms of sheaves one has $\mathcal{C} \xrightarrow{\sim} \mathcal{U}$

$\mathcal{C} \rightarrow \mathcal{D}$. Given a square of the form (32.1) with $\mathcal{C}$ open and u an epimorphism, if $\mathcal{E}$ is in $\mathcal{C}$, $\mathcal{E}$ can locally be lifted to a section of $\mathcal{C}$. As $\mathcal{C}$ is open, it follows that locally on $\mathcal{C}$, $\mathcal{C} \rightarrow \mathcal{D}$ is represented by an open subset. Applying Lemma 14 one concludes that $\mathcal{C}$ is open. The same argument shows that if we have cartesian diagrams $\mathcal{C}$ is open. This follows from transitivity of pull-backs. Conversely,

$\mathcal{C} \rightarrow \mathcal{D}$
with each
open and
 $\mathcal{C} \xrightarrow{+} \mathcal{D}$
 $\mathcal{C} \xrightarrow{u} \mathcal{D}$
onto, then
 $\mathcal{C}$ is open.

□

Proposition 65 (33). The property “open” is stable by push-outs.

Proof. Suppose

$/$

$/$

$+$

is a cocartesian diagram, with open . In particular is a monomorphism, and it follows that is a monomorphism and that the square is cartesian as well. The

is an is onto. The pull-back of by morphism

isomorphism (being a monomorphism) hence open. The pull-back of by is just , open by assumption. It follows that is open.

$/$

We now fix a class following stabilities

6 6 C C 6 6 C , taking : here the lifting is to , 1. Start with 6 2. Assume 6 " 6 ; the succeeding liftings then cannot be to , : they must be to 3. Shrink , first so that it maps to 6 , next so that it induces an isomorphism from I 6 to C C As / is a monomorphism the cocartesian (35.2) is cartesian as well. The composition , $T I > T I > TI >$ gives by pull-back a factorization of / as / /

C

with each

/

/

cartesian and cocartesian, hence / / T T . Further, the morphism I X , hence X T T I > lifts to T I > lifts to / . It follows that / / is a push-out of I6 , which is in = , and T I >

T

solidity follows.

/

□

Remark 69 (1). Another formulation of Proposition 35 is: a morphism solid if and only if the pointed sheaf is an iterated extension of in , in the sense that there are morphisms

/

6 =

, of the form $TI >$.

Proposition 70 (36). *If / is open and*

is

=-

TI > 's with

/

with each

is

=

= -solid, then is = -solid.

Proof. In the proof we say “solid’ instead of “ -solid’. Let (*) be the property of a sheaf that any open is solid. If is solid, sits at the end of a

/

chain #

with each

push out of some for in . We prove by induction on that $>$ satisfies (*). For , is in . If - is representable and $\#$ is open, it is of the form $>$ open in , hence solid by Condition 34(1). - for It remains to check that if in a cocartesian square

$$\begin{array}{c} \text{,} \\ = \\ \text{,} \\ = \\ / \\ > \\ - \end{array}$$

(36.1)

the sheaf satisfies (*), so does . In (36.1), $>$ - is a monomorphism and the square (36.1) hence cartesian as well as cocartesian. Fix open, and take the pull-back of (36.1) by . It is again a cartesian and cocartesian square and, being open, it is of the form

$$\begin{array}{c} / \\ T \\ X \end{array}$$

(36.2)

$/ /$ where is open in and 6 . The diagram $/ /$

$$\begin{array}{c} / \\ / \\ / \end{array}$$

expresses as an extension of $-I > X$ by

□

Remark 1 using (*) for and the fact that

$X \text{ IT}$

$-I >$

$-I > T$

$/$ and one concludes by is in $=$.

Proposition 71 (37). *The pull-back of a solid morphism by an open morphism solid. In particular, if is open and if is solid, so is .*

$$\begin{array}{c} / \\ / \\ \mathcal{E} \text{ is} \end{array}$$

Proof. Since the pull-back of an open morphism is open, it suffices to check the proposition for a push-out of $>$ - for open in :

$$\begin{array}{c} > \\ - \end{array}$$

Pulling back by , we obtain a cocartesian square

$$\begin{array}{c} > \\ - \end{array}$$

$/ /$ with open in and open in . This shows that $/ /$ is solid.

Suppose now that we are given two classes $=$ and $=$ of open embeddings satisfying conditions 34. We define $=$ as the smallest class stable by Condition 34 containing the

$6 \ 6 \ 6 \ 6$ for 6 in $=$ and 6 in $=$.

□

Example 72 (2). If $=$ is a class of all open embeddings and $=$ is the class of those 6 for which acts freely outside , then $= = =$.

Proposition 73 (38). *If the pointed sheaves $/$ and $/$ are respectively $=$ and $=$ -solid, the $/ /$ is $= =$ -solid.*

3.2 A Criterion for Preservation of Local Equivalences

[. Our aim in this section is to prove the

$$a \ a /$$
$$a$$
$$a$$

Suppose that

/

$$/ a$$

$\%$

$[$

is an upper distinguished square. Adding a base point, we obtain . The morphism is then a local equivalence. Let us check that is a $A \rightarrow A$ weak equivalence. As commutes with coproducts, this morphism is deduced from the commutative square

a

a

$a \rightarrow a \rightarrow X$

$a \rightarrow \mathbb{Z} \rightarrow a \rightarrow -$

a

$[$

by applying the same construction (23.3). This square is cocartesian because is. The top horizontal line being a monomorphism, it is homotopy cocartesian, and the claim follows. As commutes with colimits, this special case implies that more generally one has

a

Lemma 77 (15). If is in the $-$ -closure of the a weak equivalence.

0

A

as above, then a is

$/$, $S/ /$ is a $[S/ /$ is $/$ a local S/ S

Proposition 78 (42). (Proof of Theorem 6) For any pointed sheaf local equivalence. Indeed for any connected in , a weak equivalence by Construction 29. It follows that for equivalence,

$/$

aS

is a commutative square of local equivalences. By Lemmas 15 and 12, is a weak equivalence. It remains to see that is a weak equivalence – and the same for . For this it suffices to see that for a pointed ind-solid sheaf , is a weak equivalence. As and commute with filtering colimits, the ind-solid reduces to solid, and by the inductive definition of solid, it suffices to prove the following lemma.

$aS/$

$aS/ a/ a S$

$a/$

$/$

be an open embedding. If in a cartesian square of pointed $> -$

$[$

$/ /$ is such that $aS/ a/$ is a weak equivalence, the same holds for .

Lemma 79 (16). Let sheaves

Proof. Consider the cocartesian square

$[$

$S \rightarrow S \rightarrow -$

$S/$

$S [$

One can easily see that the top morphism is a monomorphism. It follows that is point by point homotopy cocartesian, and is a local equivalence. The functor of Construction 29 transforms a monomorphism into a coprojection of the form 5 . It follows that each is of the form $> >$ and, by Lemmas 15 and 12, is a weak equivalence. It remains to show that is a weak equivalence.

$\%$

S

$\%$
 $aS \ aS \ a$
 aS
 $S \ S$
 $a \ S \ a[$
 $[[$
 $S \ a \ aS / \ a / \ a[\ a[\ aS \ a \ aS \ a$

Let us apply to the morphism of cocartesian squares . By Construction 29 both and are homotopy $> >$ equivalences, and remain so by applying . We assumed to be a and weak equivalence. As are cocartesian with a top morphism which is a monomorphism (by the assumption on , for), it follows that is a weak equivalence. Hence so is . □

4 Two Functors

5.1 The Functor

One has a natural morphism of sites

$2 [.$

$[.$

given by the functor

$2 [[$ with the trivial $-$ -action Indeed, the functor 2 commutes with finite limits and transforms covering families

into covering families. In particular the functor presheaf

2 is continuous: if $/$ is a sheaf on $[.$, the $/$ with the trivial $-$ -action is a sheaf on $[.$. The functor 2 has a left adjoint Q . As 2 is continuous, the functor Q is cocontinuous, and the functor 2 from sheaves on $[.$ to sheaves on $[.$ is $/$ sheaf associated to the presheaf $/$

Proposition 80 (43). *The cocontinuous functor Q is also continuous, that is, if $/$ is a sheaf on $[.$, the presheaf $/$ on $[.$ is a sheaf.*

Proof. By Lemma 2 it is sufficient to test the sheaf property of $/$ for a covering of deduced by pull-back from a Nisnevich covering 6 of . Passage to quotient commutes with flat base change. Taking as base , this gives that $-I: 6 \rightarrow 6$ identifies 6 with the quotient of $-I: 6$ by . Similarly, if $6 \rightarrow -I: 6$, the quotient by of the pull-back to of 6 is 6 again. This reduces the sheaf property of $/$, for the covering of by the $-I: 6$, to the sheaf property of $/$ for the covering 6 of .

$Q /$

Q

$Q \ Q \ Q /$

The functor

gives rise to a pair of adjoint functors between the categories of presheaves on and , with being

. As is continuous , it induces a similar pair of adjoint functors between the categories of sheaves. This pair is

$[$

$[$

$2\#$

associated sheaf $\mathcal{A} \in Q \rightarrow 2 \rightarrow Q$ so that one has a sequence of adjunctions $2\# \rightarrow 2 \rightarrow 2$. If $/$ on $[$ is representable: $/ -$, then $2\# / -I: .$ In particular, $2\#$ transforms the final sheaf K on $[.$, also called “point”, into the final sheaf on $[.$, and $2\# \rightarrow 2$ is a pair of adjoint functors in the category of pointed sheaves as well. It is clear that $2\#$ takes solid sheaves to solid sheaves. We also have the following. □

Proposition 81 (44). *Let $/$ be a pointed sheaf solid with respect to open embeddings $\hookrightarrow$ of smooth schemes such that the action of π_1 on π_0 is free outside $\emptyset$. Then $2\# /$ is solid with respect to open embeddings of smooth schemes.*

Proof. If $\emptyset$ is the open subset of $\emptyset$ where the action of π_1 is free, then $\emptyset \hookrightarrow \emptyset$ and if $\emptyset \hookrightarrow \emptyset$, a push-out of $\emptyset$ is also a push-out of $\emptyset$: we gained that the action is free everywhere. The next step is applying $2\#$, from pointed sheaves on $\emptyset$ to pointed sheaves on $\emptyset$. This functor is a left adjoint, hence respects colimits and in particular push-outs. It transforms π_1 to π_1 , and in particular, for $\emptyset$, the final object into the final object. To check that it respects solidity it is hence sufficient to apply:

smooth over $\emptyset$, then $\emptyset$ is smooth. *Proof.* If $\emptyset$ is finite etale, for instance $\emptyset$, the case which most interests us, this is clear, resulting from being etale. In general one proceeds as follows. The assumption that π_1 acts freely on π_0 implies that π_1 is a π_1 -torsor over $\emptyset$. In particular, π_1 is faithfully flat. As π_1 is flat over $\emptyset$, this forces π_1 to be flat over $\emptyset$. To check smoothness of $\emptyset$ it is hence sufficient to check it geometric fiber by geometric fiber. For $\emptyset$ a geometric point of $\emptyset$, smoothness of $\emptyset$ amounts to regularity. As $\emptyset$ is smooth over $\emptyset$, hence regular, and $\emptyset \rightarrow \emptyset$ is faithfully flat, this is [4] (an application of Serre's cohomological criterion) $\square$

Lemma 82 (17). *If π_1 acts freely on π_0 for regularity).*
2

Proposition 83 (45). *The functor $\#$ respects local (resp. A -) equivalences between termwise ind-solid simplicial sheaves.*

$/ \hookrightarrow /$ be a local equivalence between termwise ind-solid simpli[. To verify that $2\#$ is a local equivalence it is sufficient to in [and the map

$$2\# / \hookrightarrow 2\# / \text{, LO- } 2\# / \hookrightarrow 2\# / \text{, LO-}$$

Proof. Let cial sheaves on check that for any

$2\#$ is a left adjoint, the functor

$$/ \hookrightarrow 2\# / \text{, LO- (45.1)}$$

$\emptyset$ in $\emptyset$, $\emptyset$ commutes with colimits. For an open embedding $\emptyset \hookrightarrow \emptyset$ is again an open embedding and we can apply to (45.1) Theorem 6. $/ \hookrightarrow$ be an A -equivalence. Consider the square Let $/ \hookrightarrow$ is a weak equivalence of simplicial sets. Since

$$@ S / S /$$

$/ \hookrightarrow$ By the first part of proposition $2\#$ takes the vertical maps to local equivalences. Since $2\#$ commutes with colimits, Lemma 13 implies that $2\# S$ is in the 0 closure of the class which contains $2\# A$ for $\emptyset$ upper distinguished and $2\# A$ for in $\emptyset$. By Theorem 4 it suffice to prove that

morphisms of these two types are A -equivalences. For morphisms of the first type it follows from the first half of the proposition. For the morphism of the second type

$$2$$

$$\text{and } 2\# D = !$$

it follows from the fact that morphisms $\# A$

A are mutually inverse A -homotopy equivalences.

Define $L2\# A$

A (and similarly on AA) setting $2\# S / L2\# /$

$$S /$$

$$2$$

where $\emptyset$ is defined in Construction 29. Proposition 45 shows that $L \#$ is well defined and that for a termwise ind-solid one has $L \# \#$. $\square$

5.2 The Functor

$$(45.3) \quad \begin{array}{ccc} / & \% & \\ & & \end{array}$$

is cocartesian as well.

[. has enough points: as a consequence of Lemma 2, for , the functor $/ AM' (/ -I$: 6 the limit being taken over the Nisnevich neighborhoods of in , is a point (a fiber functor). The class of all such functors is clearly conservative. Such a functor depends only on $-I$: , where is the henselization of at , and can be any equivariant $-$ scheme which is a finite disjoint union of local henselian schemes essentially of finite type over , and for which is local. We call such a scheme $-$ local henselian, and write $/ /$ for the corresponding

Proof. The site each in and

[fiber functor. We will show that (45.3) becomes cocartesian after application of any of the fiber] functors defined above. It suffices to show that for any in , the fiber of (45.3) above is cocartesian in . This fiber is of the form

$$\begin{array}{c} / \\ / \\ \& \\ \& / \% \\ L \\ \& \end{array}$$

and such a square is cocartesian if and only if whenever U or V is empty, the other is reduced to one element. Here, we also know that π is injective. It hence suffice to check that if U is empty, then V is reduced to one element. Fix in U , and view it as a section of π over K . Let K be

U the open equivariant subset where it is in U . The assumption that π be in

means that the degree of the fiber of π at a closed point of U is at least n . By G -equivariance of π , this degree is independent of the chosen u . We have to show that if U is not in U , that is if this degree is exactly n , then U is the

U image of a unique element of U .

&

$U \rightarrow U$!

&

$U \rightarrow U$ %

$U \rightarrow U$ % %

$U \rightarrow U$ % . . ! &

The scheme U is a disjoint union of G -local henselian schemes U_i . By assumption, (45.2)? U is cocartesian, hence if U is not in U on U_i , then on U_i it comes from a unique u in U . Let U_i be the union of those U_i on which U is in U , and U_j be the union of U_i on which it is not. That U is in U but not in U , means that U_i is of degree n over U . On U_i , U is in U . On U_j , it comes from a unique u in U . The section $U \rightarrow U$ in U on U_i , U on U_j of U over U is a section of $U \rightarrow U$ on lifting U . It is the unique such lifting: any other lifting U , viewed as a section of U on U_i , can be in U at most on U_i , hence must be in U on the whole of U_i which has just the required degree over U . This determines U uniquely on U_i , where it is in U , as well as on U_j , where it is the unique lifting of U to U .

Proof of Theorem 7: The induction which works to prove Theorem 7 is the following. As U is solid, it sits at the end of a sequence

$U \rightarrow U$

$U \rightarrow U$

$U \rightarrow U$, /

$U \rightarrow U$

$U \rightarrow U$ [

where each U_i . We prove U is a push-out of some open embedding in U by induction on that for any U_i , U_i is solid. For U_i , U_i is representable, U_i

U_i hence so is (1). A fortiori, U_i is solid. For the induction step $U \rightarrow U$ one applies the following lemma to U

U .

$U \rightarrow U$

$U \rightarrow U$

□

Lemma 88 (19). *Let*

$U \rightarrow U$

$U \rightarrow U$, /

$U \rightarrow U$

$U \rightarrow U$

$U \rightarrow U$

$U \rightarrow U$ be a cocartesian square with open in U . Suppose that for any C , $U \rightarrow U$ is $U \rightarrow U$ solid. Then $U \rightarrow U$ is solid.

Proof. As $U \rightarrow U$ is open by Proposition 33, the $U \rightarrow U$ are defined. It suffices to prove that for each U_i , the open morphism $U_i \rightarrow U_i$ is solid.

By Lemma 18, this morphism sits in a cartesian and cocartesian square $U \rightarrow U$ fiber product $U \rightarrow U$

$UV \rightarrow V$

$\rightarrow$

$-$

(45.4)

$\rightarrow$

$\rightarrow$ By assumption, $\rightarrow$ is solid. It follows that $\rightarrow$

□

Proposition 37 to the open morphism $\rightarrow$

$\rightarrow$

$\rightarrow$

$\rightarrow$

$\rightarrow$ - is solid too (apply $\rightarrow$). As $\rightarrow$ is open, $\rightarrow$

408 P. Deligne

so is $\rightarrow$, and by Proposition 36, $\rightarrow$ of a solid map.

$\rightarrow$ is solid. The map $\rightarrow$ is then solid as a push-out

$\rightarrow$?

$\rightarrow$ / / / , / / / / , /

Example 89 (7). It is not always true that if $\rightarrow$ is a solid morphism, so is $\rightarrow$. Take the trivial group and two points (i.e. $\rightarrow$). Then $\rightarrow$. For any sheaf $\mathcal{F}$, the inclusion of $\mathcal{F}$ in $\mathcal{F}$ is solid (deduced by push-out from $\#$), and applying $\rightarrow$, we obtain $\rightarrow$. Pulling back by the natural map from $\rightarrow$ to one of the summands (an open map), we see that if $\rightarrow$ is solid, so is $\rightarrow$.

$\rightarrow$,

$\rightarrow$

$\rightarrow$

Corollary 90 (46). If $\rightarrow$

In particular, if

$\rightarrow$

is open and solid, then $\rightarrow$ is pointed solid, so is $\rightarrow$.

$\rightarrow$ / /

$\rightarrow$

$\rightarrow$

is solid.

$\rightarrow$ is open and one applies Theorem 7 and Proposition 36.

We now define for pointed sheaves on $\mathcal{C}$ a “smash” variant of the construction $\rightarrow$. If we assume that the marked point $\rightarrow$ is open, it is $\rightarrow$ / / $\rightarrow$ / $\rightarrow$, that is $\rightarrow$ with $\rightarrow$ contracted to the new base point. This definition can be repeated for any pointed sheaf if, for any monomorphism $\mathcal{F} \rightarrow \mathcal{G}$, we define $\mathcal{F} \rightarrow \mathcal{G}$ to be the following subsheaf of $\mathcal{F} \rightarrow \mathcal{G}$: a section $\mathcal{E}$ of $\mathcal{F} \rightarrow \mathcal{G}$ is in $\mathcal{F} \rightarrow \mathcal{G}$ if for any non empty U , there exists a commutative diagram ?

Proof. with non empty U and $\mathcal{E}$ in $\mathcal{F} \rightarrow \mathcal{G}$ on U .

□

Example 91 (8). Under the assumptions of Example 6, if $\rightarrow$ is open in $\mathcal{C}$ with $\rightarrow$ complete is

ment and if $\mathcal{F}$ has the natural $\rightarrow$, then $\rightarrow$ - $\rightarrow$ [$\rightarrow$, where action of $\rightarrow$. In particular, if $\mathcal{F}$ is the Thom space of a vector bundle over X (that is, $\mathcal{F} \rightarrow X$ with $\mathcal{F} \rightarrow X$ contracted to the base point), then $\rightarrow$ is the Thom space of the $\rightarrow$ -equivariant vector bundle $\mathcal{F}$ on X .

$\mathcal{C}$

$\rightarrow$

$\rightarrow$

$\rightarrow$

$\rightarrow$

$\rightarrow$, B

Proposition 92 (47). *If a pointed sheaf $\mathcal{F}$ is pointed solid, that is if $\mathcal{F}$ is solid, then so is $\mathcal{F}^*$.*

Proof. As $\mathcal{F}$ is solid, the open morphism $\mathcal{F} \rightarrow \mathcal{F}^*$ is solid too (Proposition 36), and $\mathcal{F}^*$ is deduced from it by push-out.

The definition of $\mathcal{F}^*$ immediately implies the following: □

Lemma 93 (20). *Let X be a $\mathbb{A}^1$ -local henselian scheme. Then $\mathcal{F}^* \rightarrow \mathcal{F}^*$*

where

$\mathcal{F}^$ are $\mathbb{A}^1$ -local henselian schemes such that $\mathcal{F}^*$*

$\mathcal{F}^$*

$\mathcal{F}^$ respects local and $\mathbb{A}^1$ -equivalences.*

Proof. Let $\mathcal{F} \rightarrow \mathcal{F}^*$ be a local equivalence. To check that $\mathcal{F}^* \rightarrow \mathcal{F}^*$ is a local equivalence it is enough to show that for any $\mathbb{A}^1$ -local henselian X , the map $\mathcal{F}^*(X) \rightarrow \mathcal{F}^*(X)$ □

Proposition 94 (48). *The functor*

is a weak equivalence of simplicial sets. This follows from Lemma 20. Let $\mathcal{F} \rightarrow \mathcal{F}^$ be an $\mathbb{A}^1$ -equivalence. By the first part it is sufficient to show that $\mathcal{F}^* \rightarrow \mathcal{F}^*$ is an $\mathbb{A}^1$ -equivalence. We use the characterization of $\mathcal{F}^*$ commutes with filtering col $\mathbb{A}^1$ -equivalences given in Theorem 5. Since $\mathcal{F}^*$ limits and preserves local equivalences it suffices to check that it takes $\mathbb{A}^1$ -homotopy equivalences to $\mathbb{A}^1$ -homotopy equivalences. This is seen using the natural map*

$$\begin{array}{c} S \\ S/ \\ S \\ / \mathbb{A} \\ / \\ / \\ / \mathbb{A} \end{array}$$
