

# Interlanguage and Mathematical Translation Methodology Sidecar

Public archive map, corpus controls, and bounded research checkpoints

**Open this document first.** It explains what the public archive contains, where the full mathematical readers live, and which claims are and are not supported.

## Version 0.13 - 18 July 2026

This record is the methodology, provenance, corpus-control, and programme-state sidecar for the mathematical transcription and translation archive. Its title describes the complete public role, not only the newest upload.

Full readers remain on the author or series records. This sidecar preserves source-body baselines, automata and terminology work, decision and audit methods, language-manager state, reproducible checks, and bounded language experiments.

## Stable public homes

| Corpus        | Stable concept DOI      | Public role                                                                    |
|---------------|-------------------------|--------------------------------------------------------------------------------|
| Interlanguage | 10.5281/zenodo.21124403 | Methods, provenance, corpora, automata, ledgers, and bounded experiments       |
| Emmy Noether  | 10.5281/zenodo.20412587 | Source controls, readers, editable translations, and bounded paper checkpoints |
| SGA 1, 5, 6   | 10.5281/zenodo.20410947 | Working readers, source repair, and bounded translation checkpoints            |
| SGA 2         | 10.5281/zenodo.20393488 | French reader and source-aligned English checkpoints                           |
| Deligne       | 10.5281/zenodo.20410853 | Paper transcriptions and cautiously classified source-issue sidecars           |

## What the record contains

The current version retains all earlier numbered packages and replaces only the current front document and status note. Numbering gives readers a stable map without turning each new checkpoint into a misleading new title.

| Package | Contents                                                                                                            | Boundary                                                               |
|---------|---------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| 01-10   | Programme provenance, weighted automata, terminology, grouped source bodies, inventories, hashes, and route returns | Historical and operational evidence; mixed status retained             |
| 11-12   | Consolidated workflow, research-department method, and automata                                                     | Methodology, not translation completion                                |
| 13      | Original Interslavic normalization method and evidence                                                              | Reproducible internal normalization                                    |
| 14-15   | Romance v10 evidence and Noether R823 completion gate                                                               | Bounded gates and evidence surfaces                                    |
| 16      | Eight-lane language-manager fleet snapshot                                                                          | Manager state plus selected bounded outputs                            |
| 17a     | Romance corpus, WordWeb, governance, T008, language profile, acceptance, and Rumantsch metadata                     | No native validation or rights-clearance claim                         |
| 17b     | Interslavic normalization through Tranche 007 and final audit                                                       | Internal linguistic normalization; external authority blocker retained |
| 17c     | Compact standalone Romance WordWeb/access checkpoint                                                                | Metadata-only public projection                                        |

The public packages are organized ZIPs with manifests. Raw rights-restricted bodies, private host paths, credentials, and internal task identifiers are excluded from the new public projections.

# Romance checkpoint

The Romance package is a public-safe projection of a larger private operational tree. It combines corpus coverage, WordWeb/access, controlled-language decisions, governance, QA, and one bounded output without claiming that the lane is complete.

**WordWeb and access.** 60 concepts, 106 explicit senses, 39 extension nodes, 811 metadata-only evidence records, 954 sense-by-cohort rows, 78 supported senses, and 28 explicit gaps.

**Corpus metadata.** 153 records: 147 primary unique records and six aliases. Sixty-one standards or varieties are named; 11 have an active body and 50 remain zero-body.

**Controlled Romance.** Eight bounded source-keyed units and 19 aggregate PDF pages. The package includes the two-page T008 unit; the continuation cursor is German R823 authority line 21309.

**Rumantsch Grischun.** Metadata and QA identify one deduplicated 30-page official school-mathematics body. The source body is excluded because redistribution rights are unresolved.

Zero native-language validations, zero human intelligibility observations, zero pilot-eligible rows, and zero form promotions. Diagnostic access values are design evidence, not measured comprehension.

## Interslavic checkpoint

The Noether production corpus contains 221 canonical Latin-script TeX units and 221 paired Cyrillic-script units. The sidecar records normalization Tranches 002A through 007 and the final streaming audit.

Tranches 003-007 record 1,111 replacements across 247 distinct units. They cover the reviewed correspondence family, a declared simultaneity policy, four tokenized context queues, a bounded algebraic-ring competitor, and one final diacritic correction.

The final audit covers all 221 Latin units. The remaining explicit external-authority blocker is the mathematical sense extension of 353 *vazi\*/vaze\** probes in 101 files.

Mechanical closure, clean builds, render integrity, internal linguistic normalization, source fidelity, and community acceptance are separate statuses. This release does not collapse them.

## Reproducibility controls

Every lane is required to maintain stable source, target, structural, decision, and difficulty IDs; machine-readable statement and paragraph indices; append-only decision logs; and append-only hard-part/failure ledgers.

CSV remains useful for inspection. JSON, JSONL, SQLite, or another schema-capable authority is required when hierarchy, cross-reference, or one-to-many relations cannot be represented faithfully in a flat table.

## Claim boundary

The included materials are working translations, source controls, corpus evidence, normalization experiments, and reproducible audit artifacts at explicitly bounded levels.

They are not critical editions, peer review, proof certification, native-language endorsement, universal mathematical validation, rights determinations, or completed translations unless a particular file states a narrower verified completion claim.

Generated OCR, VLM, and CUDA extraction are witnesses or locators unless a source-audited body is explicitly identified. A clean build does not establish linguistic correctness. A normalized interlanguage form does not establish community acceptance. A full-looking reader may still contain inherited or draft authority layers, which must remain visible.

Use the manifests and status files before reusing any payload. Corrections and stronger evidence are welcomed through the public GitHub repository.
