
Interlanguage and Mathematical Translation Methodology

Romance v10 status report and reproducibility guide

Public working-method release, 18 July 2026

Classification. This release contains maintained research infrastructure, source and routing ledgers, deterministic diagnostics, and six bounded controlled- Romance production tranches. It is not a completed Romance translation, not a native-language validation, and not an empirical intelligibility study.

What this release adds

Romance v10 binds the existing Romance corpus and WordWeb infrastructure to the current Spanish and French Noether R823 terminology ledgers. It corrects six semantic links, retains every prior attestation and adverse result, and adds no unearned language evidence. The package is designed to be rerunnable: its machine gate, manifest, builders, ledgers, source bodies, and bounded production outputs are included together.

Declared language or variety routes	61
Routes with an active source body	8
Explicit zero-body acquisition gaps	53
WordWeb concepts / senses	60 / 106
Reviewed occurrence records	682
Senses with accepted support	73 of 106
Spanish / French terminology rows	101 / 93
Sense-by-cohort access rows	954
Human observations	0
Controlled production tranches	T001–T006

Four-stage state

A. Provenance and branch acquisition: not complete. The route ledger records 61 explicit routes. Eight have active bodies; 53 remain zero-body acquisition gaps. Rumantsch Grischun has three verified general school- mathematics sources but no specialist-algebra body. Five regional Romansh idioms remain separate zero-body routes and are not represented by a dominant standard.

B. Consolidated corpus: current tranche passes. Corpus v3 contains 148 representations, 142 primary unique records, six representation aliases, 66 counting-eligible records, and five excluded records. Passing this structural tranche does not close the documented branch-depth gaps.

C. Semantic alignment and access infrastructure: structurally passes, not human validated. The effective-link contract covers 104 controlled terminology rows and corrects six links. The Spanish/French production crosswalk contains 194 rows. It maps only pinned or unique exact identities and creates no new attestation. Thirty-three senses still lack accepted corpus support.

D. Controlled creation: six bounded tranches pass technical checks. T001–T006 cover German authority lines 21047–21254. Their TeX builds, final PDF copies, and 15 pinned render pages reproduce. They have not been validated by native speakers. The next authority cursor is line 21256.

The empirical boundary

The 954 access-grid rows are 106 senses crossed with nine declared cohorts. All human-result fields remain empty, every row is pilot-ineligible, and there are no form promotions. Orthographic proxy values are design diagnostics only. They do not measure intelligibility and do not authorize vocabulary or grammar choices.

A future human protocol must collect participant-level language or variety, mathematical literacy, cross-Romance exposure, randomized item order, responses and abstentions, latency, confidence, uncertainty, consent, and review metadata. Until such observations exist, no empirical marginal-intelligibility index, scalar-readiness claim, or controlled-form promotion is warranted.

Reproducing the machine gate

From the packaged directory below, run the validator:

```
interlanguage/03_projects/language_management/romance/03_redo_ultra_20260717
```

```
python scripts/validate_romance_tranche_v10.py
```

The verified release state reports:

- machine validation: PASS;
- research status: maintained infrastructure, empirical work incomplete;
- 307 hash-bound targets;
- manifest SHA-256 2281E1FEBE190A5792524B881DED0E71706B82807F15D7DD34E45B631338935D;
- gate SHA-256 9A7F82D1FB2AC86DCB84A754A6C43E8255FA67DB426B71E0F33357DFC5733761.

The validator preserves the immutable v9 predecessor, verifies the v10 semantic alignment and access successors, rebuilds the v10 manifest, and rejects missing or changed targets. Passing it certifies the declared structural and reproducibility properties only; it is not a linguistic-quality oracle.

How the archive is organized

The reader-facing PDF is accompanied by one structured evidence ZIP. Inside that ZIP, the original workspace-relative relationship among the Romance lane, its lane-control and report directories, and the canonical output PDFs is preserved so that the relative paths in the v10 manifest continue to resolve. The ZIP contains the exact manifest targets rather than an indiscriminate workspace dump.

The broader Zenodo record also retains earlier source-body baselines, the weighted Interslavic automaton and term ledgers, v0.4/v0.5 methodology material, and the v0.6 Interslavic normalization evidence. Version labels distinguish those earlier components from this Romance v10 update.

Current next work

Continue at authority line 21256; acquire sources for the 33 unsupported senses and 53 zero-body routes; obtain specialist algebra in Rumantsch Grischun and native mathematics bodies for the five regional Romansh idioms; and keep source support, adverse evidence, held candidates, lexical navigation, running-body evidence, and human observations as distinct states. Empirical claims begin only after a documented human protocol produces actual observations.

Public-use note

This is an AI-run research and translation-methodology artifact. It is supplied for inspection, reproduction, correction, and continued work. It should be cited as a versioned working release, with its explicit limitations intact. Corrections and pull requests can be proposed through the GitHub mirror.
